INTERNATIONAL CLIMATE INITIATIVE (IKI)

Introducing Important Marine Mammal Areas – IMMAs

Unwrapping a new tool for global
marine mammal and biodiversity
conservation

GOBI Webinar 1: 28.10.2020. 2pm GMT

**Erich Hoyt and Giuseppe
Notarbartolo di Sciara**
Co-chairs, IUCN Marine Mammal
Protected Areas Task Force

MARINE MAMMAL
PROTECTED AREAS
TASK FORCE

A tool to support 130 marine mammal species and the biodiversity in their ecosystems

IUCN Joint SSC WCPA Marine Mammal Protected Areas Task Force

Are marine mammals adequately protected?

NOT GOOD ENOUGH!

- 600+ (out of 17,000) MPAs have substantial marine mammal content
- no coverage for most species (e.g. beaked whales)
- ad hoc or incidental protection is rule
- political, socioeconomic bias
- Tiny % covered

IUCN Task Force co-chairs

Giuseppe Notarbartolo di Sciara

Erich Hoyt

IMMA
Secretariat

Objectives:

- **Facilitate** collaboration in our community
- **Create** opportunities for cooperation and communication
- **Assist** in achieving MPA targets and agreements
- **Enhance** capacity with new conservation tools

Task Force Regional Coordinators

Important Marine Mammal Areas (IMMAs) are a place-based conservation tool identifying:

*“discrete portions of habitat, important for one or more marine mammal species, that have the **potential** to be delineated and managed for conservation”.*

IMMAs are **NOT** Marine Protected Areas, and are **NOT** identified on the basis of management considerations.

The identification of IMMAs is an evidence-driven, purely biocentric process based on the application of scientific criteria and on the best available science.

IMMA Work Programme 2016 - 2021

- COMPLETED

- SCHEDULED

- TO BE ARRANGED*

** PRELIMINARY BOUNDARIES PROVIDED FOR SCALE OF INTENDED GLOBAL IMMA EFFORT - THE AREAS YET TO BE ARRANGED MAY CHANGE DURING THE PREPARATORY STAGES OF ANY WORKSHOP TO BE SCHEDULED AND ASSESSED.*

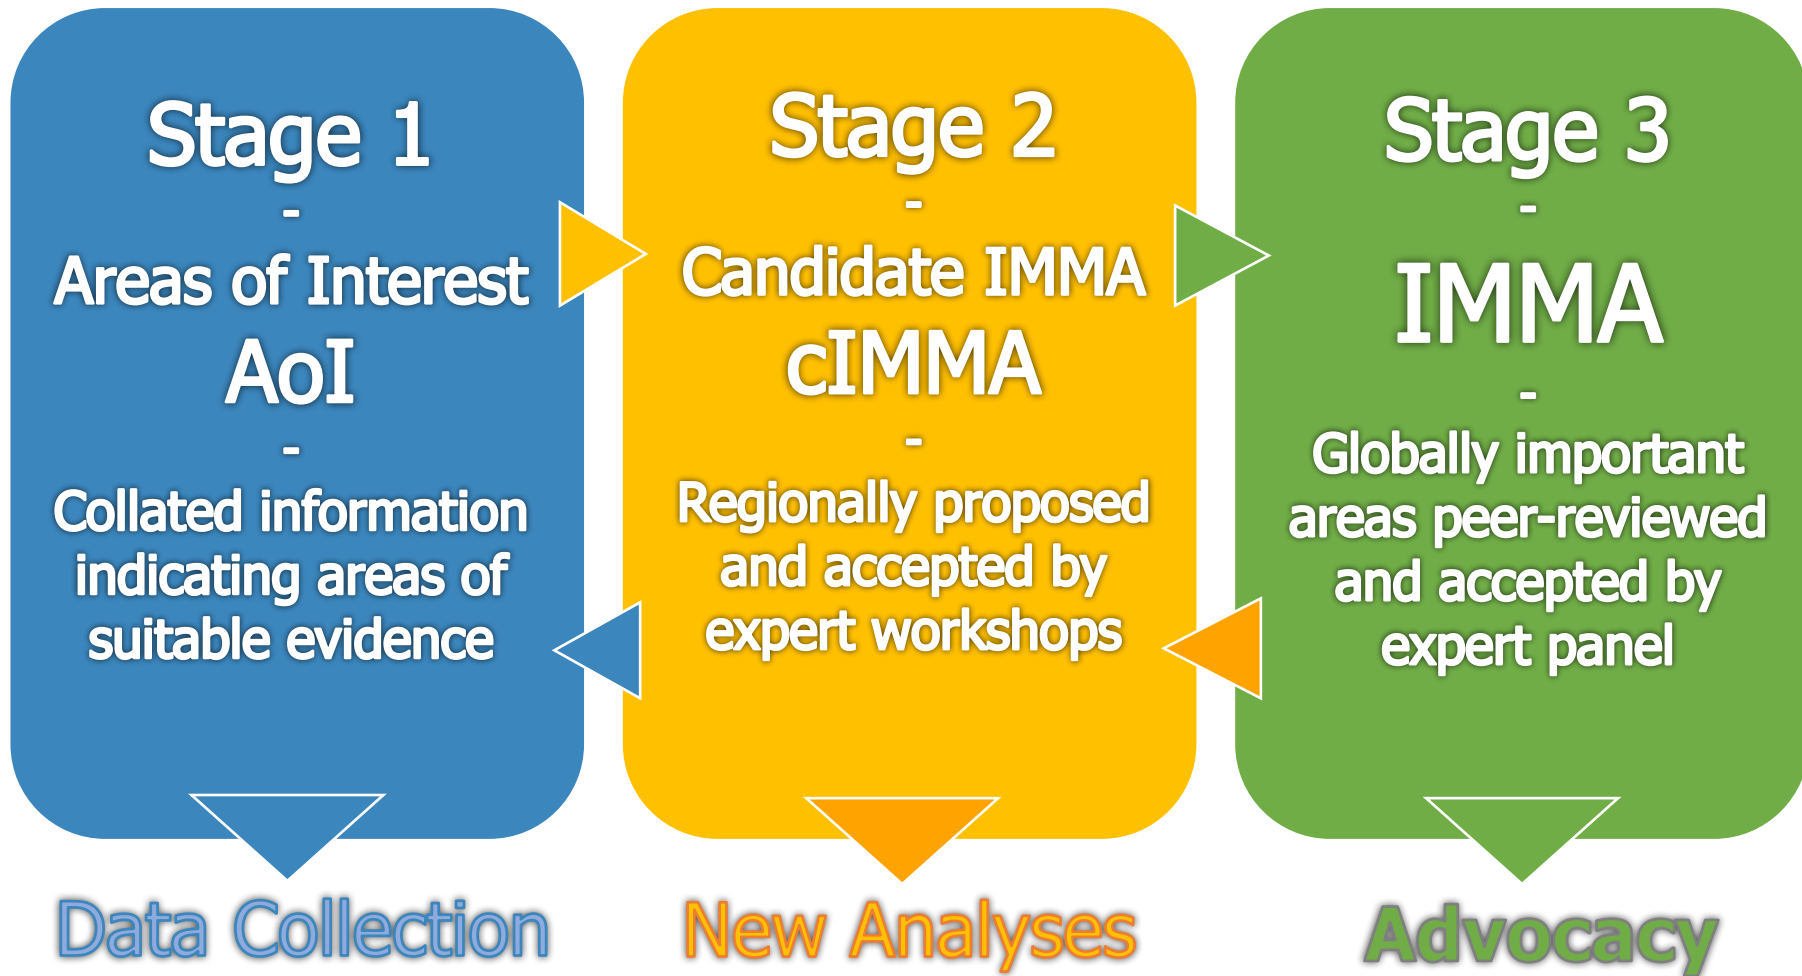

Each workshop follows a predefined process, developed in consultation with the regional marine mammal science and conservation community, to identify **candidate IMMAs (cIMMAs)** on the basis of received proposals for **Areas of Interest (AoI)**.

After the workshop, cIMMAs are submitted to **an independent Review Panel of experts**, to verify that the criteria were applied correctly and that cIMMAs were identified on the basis of robust scientific information.

Candidate IMMAs are then converted into IMMAs and are made publicly available online via the IUCN-MMPATF website and dedicated IMMA e-Atlas:

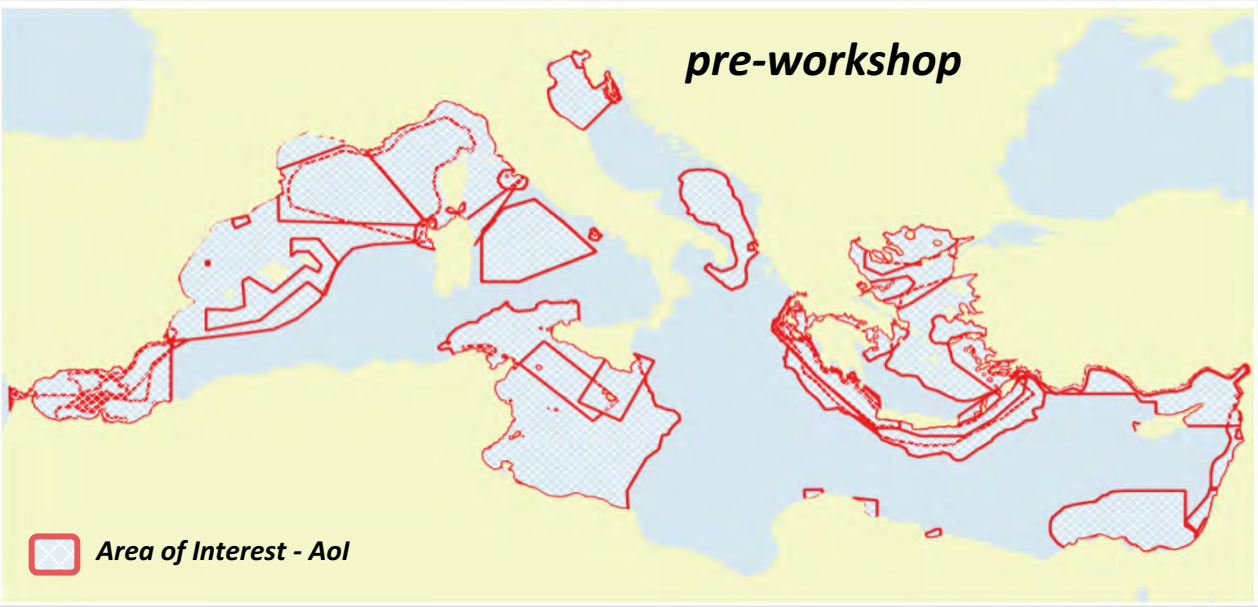

www.marinemammalhabitat.org/imma-eatlas

The Sizes of IMMAs

- The total area of all 159 IMMAs combined is 15,672,267 km².
- The largest is 2,861,819 km² encompassing an area of the Extended Southern Ocean – the Prince Edward Islands and Western Oceanic Waters IMMA – which has habitat for 2 species of fur seals, southern elephant seals and killer whales.
- The smallest is 45 km², the Akrotiri IMMA which includes breeding caves for the Mediterranean monk seal.
- 51% of IMMAs are less than 10,000 km² in size
- Only 13% of IMMAs have an area greater than 100,000 km².

TASK FORCE

Which criteria were used? 159 IMMAs Identified

IMMA e-Atlas

IMMAs cIMMAs AOI

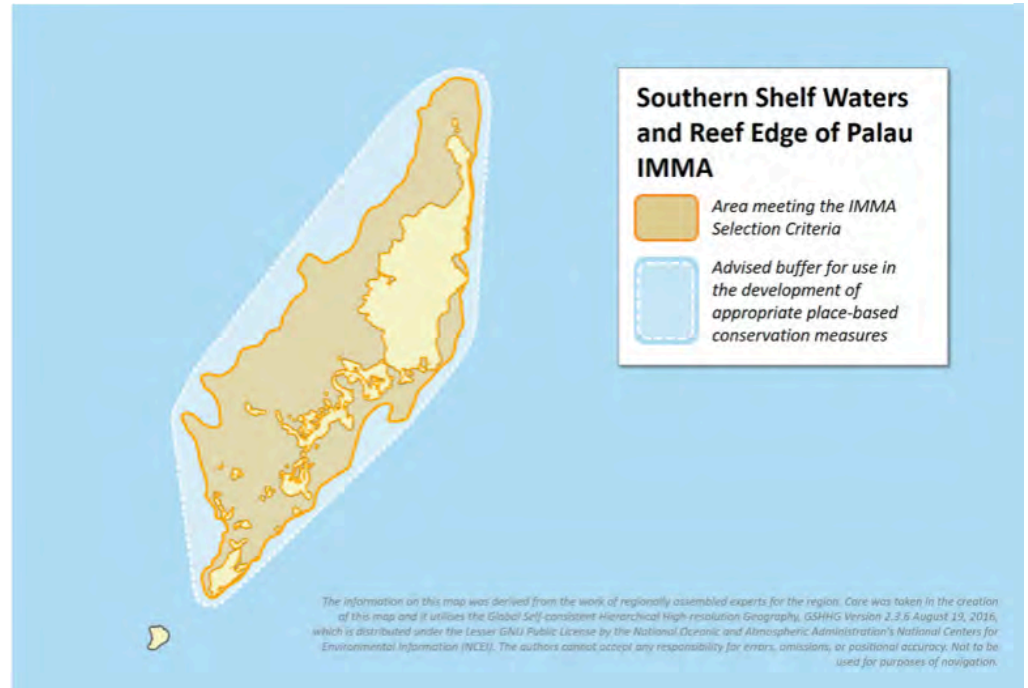

Criterion A - Species or Population Vulnerability

Areas containing habitat important for the survival and recovery of threatened and declining species.

Region: Pacific Islands

Qualifying species: dugong

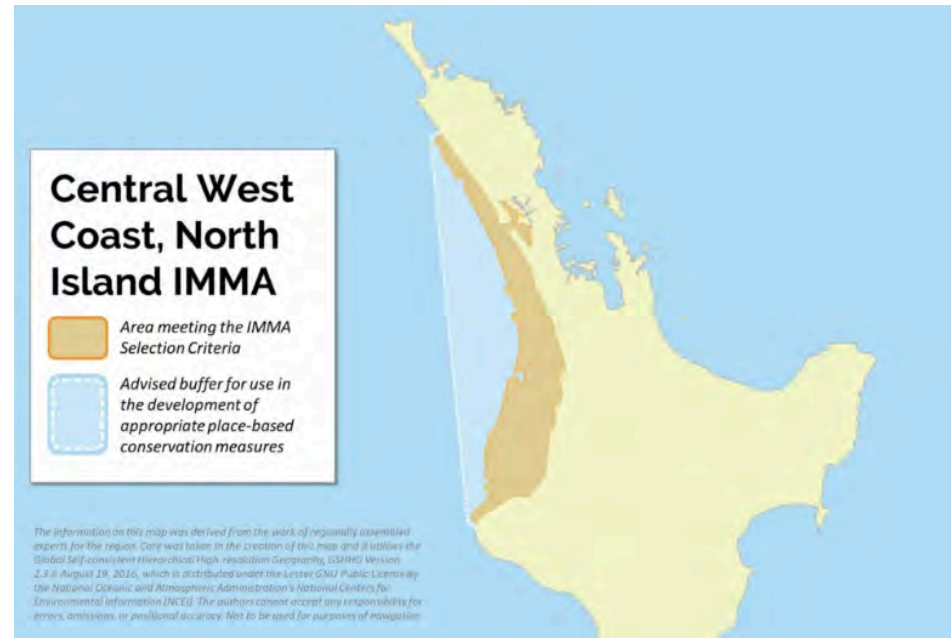

Criterion B - Distribution and Abundance

Sub-criterion B1 - Small and Resident Populations

Areas supporting at least one resident population, containing an important proportion of that species or population, that are occupied consistently

Region: Australia-New Zealand
and South East Indian Ocean

Qualifying species: Maui dolphin

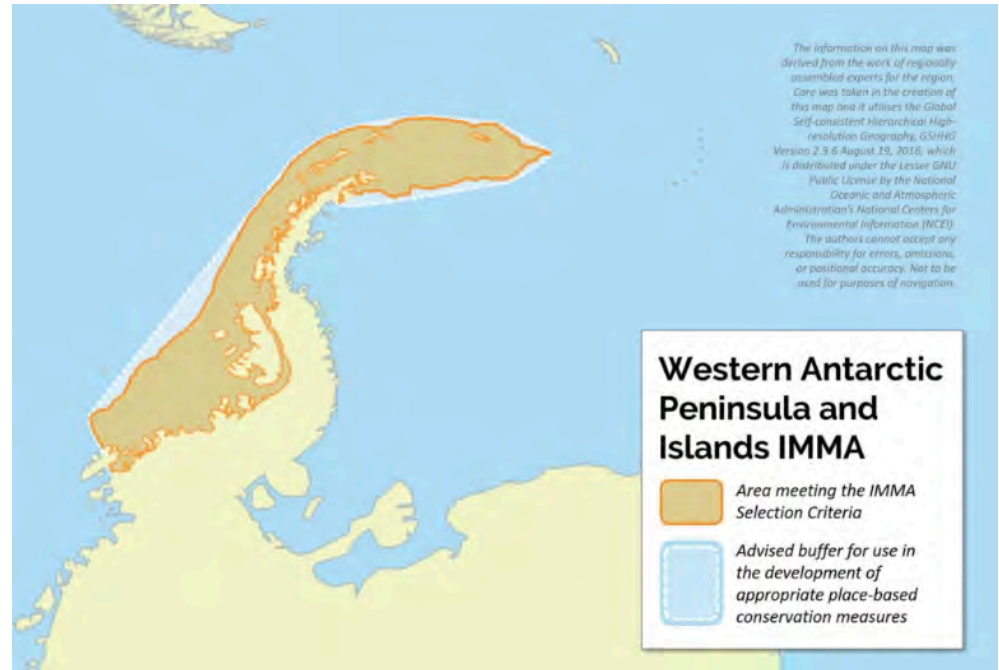

Criterion B - Distribution and Abundance

Sub-criterion B2: Aggregations

Areas with underlying qualities that support important concentrations of a species or population.

Region: Extended Southern
Ocean

Qualifying species: blue, fin,
humpback, and killer whales;
Antarctic fur seal

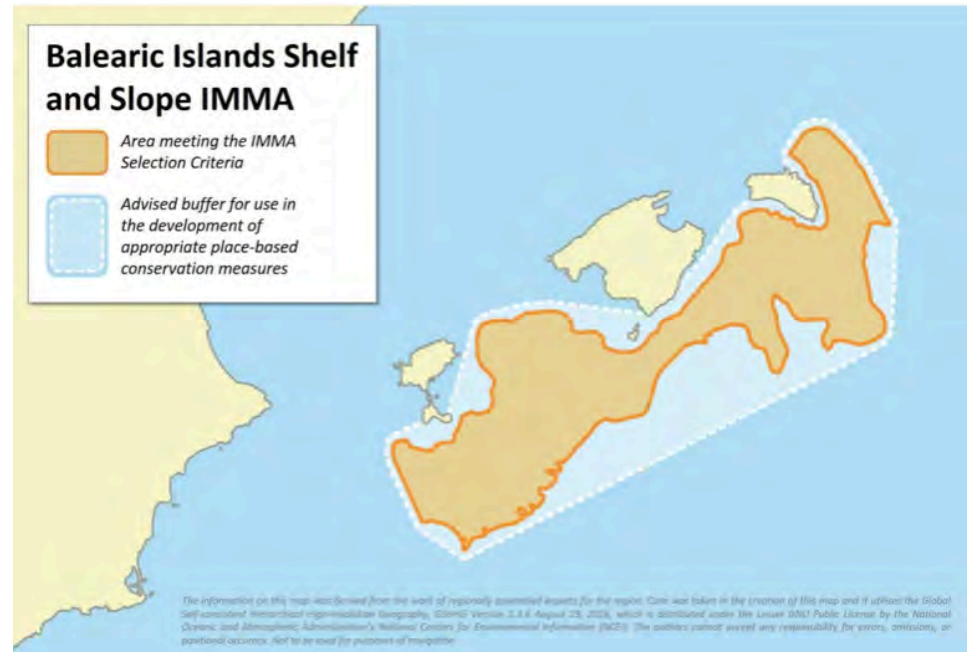

Criterion C - Key Life-cycle Activities

Sub-criterion C1 - Reproductive Areas

Areas that are important for a species or population to mate, give birth, and/or care for young until weaning.

Region: Mediterranean

Qualifying species: sperm whale

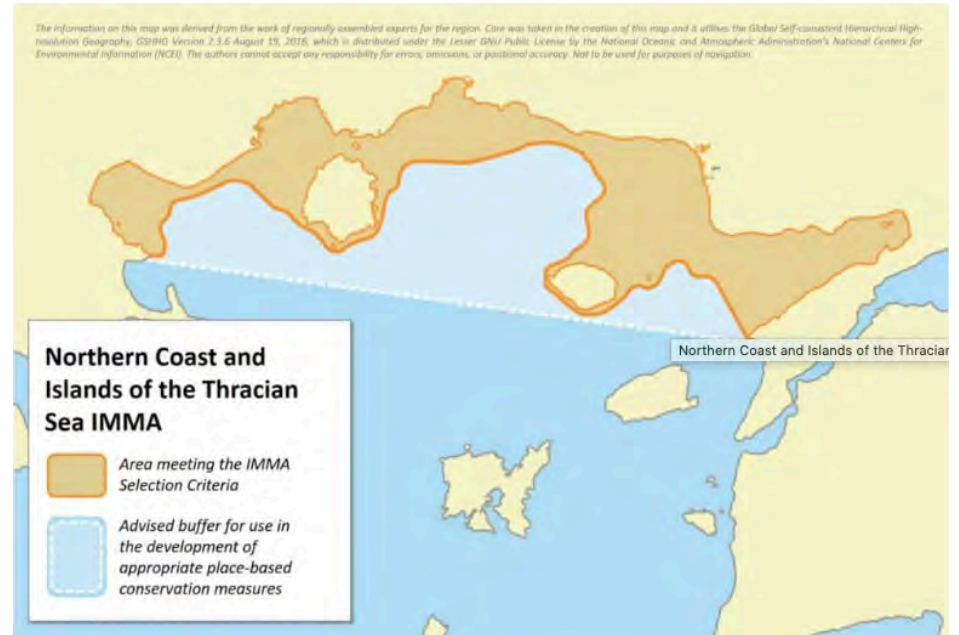

Criterion C - Key Life-cycle Activities

Sub-criterion C2 - Feeding Areas

Areas and conditions that provide an important nutritional base on which a species or population depends.

Region: Mediterranean

Qualifying species: harbour porpoise

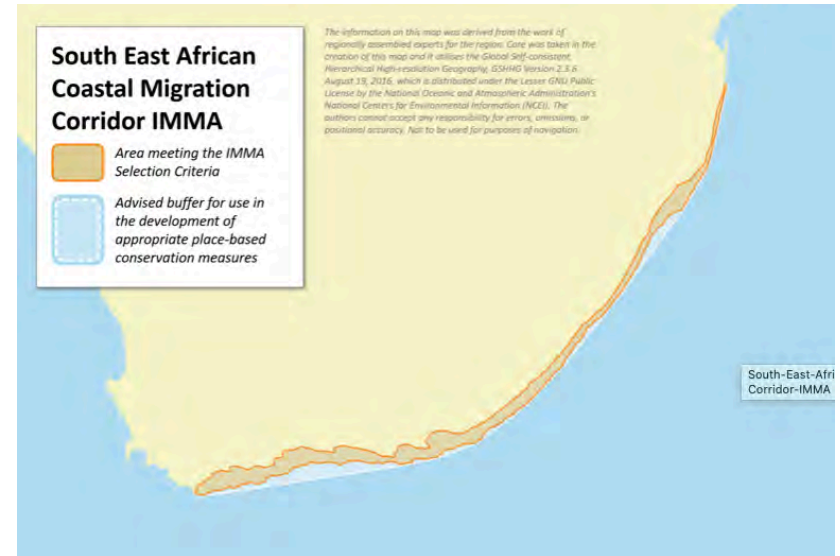

Criterion C - Key Life-cycle Activities

Sub-criterion C3 - Migration Areas

Areas used for important migration or other movements, often connecting distinct life-cycle areas or the different parts of the year-round range of a non-migratory population.

Region: Western Indian Ocean
and Arabian Seas

Qualifying species: humpback
whale

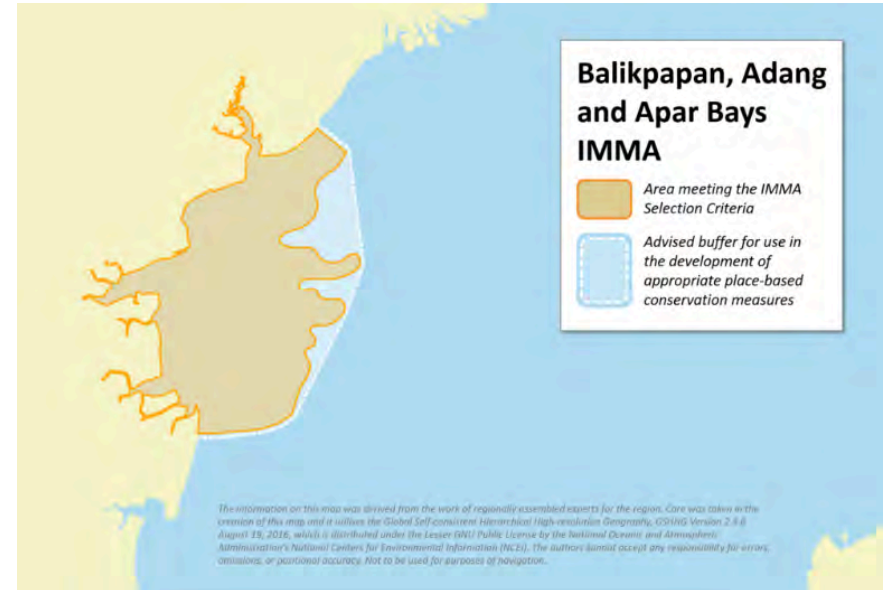

Criterion D - Special Attributes

Sub-criterion D1 - Distinctiveness

Areas which sustain populations with important genetic, behavioural or ecologically distinctive characteristics.

Region: North East Indian Ocean
and South East Asian Seas

Qualifying species: Irrawaddy
dolphin

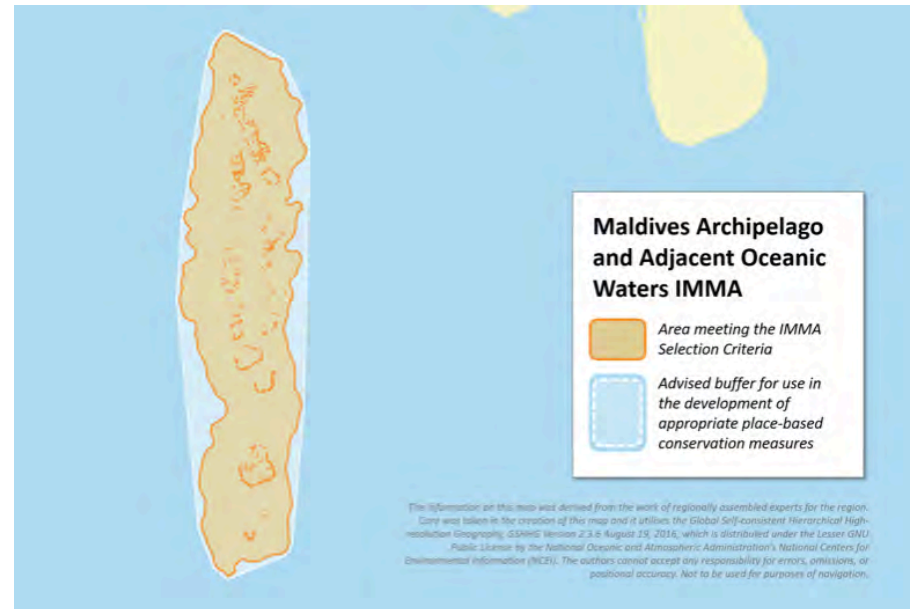

Criterion D - Special Attributes

Sub-criterion D2 - Diversity

Areas containing habitat that supports an important diversity of marine mammal species.

Region: Western Indian Ocean
and Arabian Seas

Qualifying species: 22 species of
cetaceans

Criteria used to identify IMMAs

Criteria	Species or Population Vulnerability	Distribution or Abundance	Key Life Cycle Attributes	Special Attributes
	A	B	C	D
IMMAs	129	111	132	73
% of Total	29	25	30	16

Note: Many IMMAs have been identified using several criteria.

Qualifying marine mammal species used to satisfy the IMMA criteria (only species listed as qualifying species more than 4 times are shown)

Guidance on IMMA Delineation

The following hierarchical recommendations are made to help rank the scenarios by which candidate IMMA boundaries can be confidently drawn.

- I. features which are spatially stable, supported by directly observed evidence.
- II. features which are spatially stable but rely on modelled evidence.
- III. features that are not spatially fixed/dynamic supported by directly observed evidence.
- IV. features that are not spatially fixed/dynamic and rely on modelled evidence.

Guidance on IMMA Delineation

Species A

Species B

Species C

Multi-species boundary

Guidance on IMMA Delineation

- A. cIMMA for a deep-diving species expected to utilise the 0m-4000m of the water column;
- B. cIMMA containing a diversity of near-surface and shallow-diving species observed to use the 0m-1000m of the water column;
- C. cIMMA for a shelf restricted species known to utilise both the 0m-200m of the water column and the shelf Epibenthic zone (i.e. forage in sea bottom sediments).

Guidance on IMMA Delineation

The following '**Primary**' currencies of information are considered most suitable for use in the assessment of the selection criteria for the identification of IMMA:

- P-I abundance of animals***
- P-II probability of occurrence***
- P-III observed sightings***
- P-IV area of occupancy***
- P-V extent of suitable habitat***
- P-VI range***

In addition, the following '**Secondary**' currencies of information are also considered useful for supporting the identification of IMMA:

- S-I records of key life-cycle behaviour (habitat utilization)***
- S-II measures of distinctiveness (separation)***
- S-III indices of diversity***

**Next step after
Identification:**

Implementation

IMMA identification on its own means little if there is no implementation!

Key point is that if you make a tool then you need to show people what it's good for and how to use it.

Fortunately, the need for marine mammal data in an accessible form is appreciated by many conservation processes at the local, national and regional level.

Still, there are huge gaps and a big part of our future role, along with monitoring and revising, is selling the IMMAs so that they get utilised.

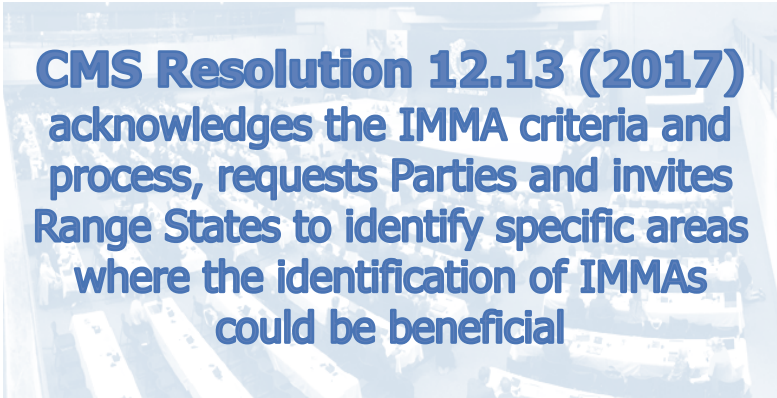

Marine Conservation and Management Initiatives using products of IMMA Process

- Convention on Biological Diversity **Ecologically or Biologically Significant Areas (EBSAs)**;
- **Marine Spatial Planning (MSP)** and management of any human activity at sea (e.g., *shipping, fishing, industrial and scientific exploration*);
- the design, adaptive management, monitoring and review of **Marine Protected Areas (MPAs)** and **MPA Networks**;
- **Key Biodiversity Areas (KBAs)** identified via the IUCN Standard;
- **Navy** conduct related to sonar testing;
- **IMO's** **Particularly Sensitive Sea Areas (PSSAs)** and other designations;
- **International Whaling Commission IWC.**

Marine Conservation and Management Initiatives using products of IMMA Process

- Convention on Biological Diversity **Ecologically or Biologically Significant Areas (EBSAs)**;
- **Marine Spatial Planning (MSP)** and management of any human activity at sea (e.g., *shipping, fishing, industrial and scientific exploration*);
- the design, adaptive management, monitoring and review of **Marine Protected Areas (MPAs)** and **MPA Networks**;
- **Key Biodiversity Areas (KBAs)** identified via the IUCN Standard;
- **Navy** conduct related to sonar testing;
- **IMO's** Particularly Sensitive Sea Areas (**PSSAs**) and other designations;
- **International Whaling Commission IWC.**

CMS Resolution 12.13 (2017) acknowledges the IMMA criteria and process, requests Parties and invites Range States to identify specific areas where the identification of IMMAs could be beneficial

Marine Conservation and Management Initiatives using products of IMMA Process

- Convention on Biological Diversity **Ecologically or Biologically Significant Areas (EBSAs)**;
- **Marine Spatial Planning (MSP)** and management of any human activity at sea (e.g., *shipping, fishing, industrial and scientific exploration*);
- the design, adaptive management, monitoring and review of **Marine Protected Areas (MPAs)** and **MPA Networks**;
- **Key Biodiversity Areas (KBAs)** identified via the IUCN Standard;
- **Navy** conduct related to sonar testing;
- **IMO's** Particularly Sensitive Sea Areas (**PSSAs**) and other designations;
- **International Whaling Commission IWC**.

Follow-up

- CBD **EBSAs** to include IMMA layers in future revision of EBSA process.
- **Marine Spatial Planning (MSP)** and management of any human activity at sea (e.g., *shipping, fishing, industrial and scientific exploration*);
- Proposed **MPAs** in Vietnam, Bangladesh and other countries are using IMMA information; **MPA Network** planning in new EU-SE Asia project will use IMMAs for network design.
- About 30 **Key Biodiversity Areas (KBAs)** have been identified in IMMA workshops.
- The **US Navy** has used IMMAs to indicate where they will avoid testing low frequency sonar.
- The **IWC** has adopted IMMAs to identify shipstrike issues and will work with **IMO** to help in identifying speed and lane restrictions

IMMA SPATIAL LAYER DOWNLOAD

The IUCN Joint SSC/WCPA Marine Mammal Protected Areas Task Force or 'IUCN-MMPATF' maintains the complete spatial dataset of Important Marine Mammal Areas (IMMA) around the world. These areas have been assessed by regional experts and were further assessed by a panel of independent reviewers.

The IMMA spatial dataset compiled by the IUCN-MMPATF is made publicly available by request under a User Licence Agreement for non-commercial use in a GIS compatible Shapefile (.shp) format to use in GIS mapping software. Please note that we do not provide shapefiles for cIMMAs or AOIs.

Full terms of use, including citation guidance and caveats, the definition of non-commercial use and commercial use, are available from the User Licence Agreement download button below.

[IMMA Layer User Licence Agreement](#)

A metadata description of the IMMA spatial dataset is also available for download from the button below. This metadata document describes the content within the most current version of the dataset made available by request and the information and spatial extent contained within the IMMA layer.

[IMMA Layer Metadata Description](#)

To make a request to download the IMMA Layer in either a GIS compatible Shapefile (.shp) or Google Earth compatible Keyhole Markup Language Zipped file (.kmz) please complete the following Contact Form. We shall endeavour to send you the requested files as soon as we can although for some enquiries this may take longer due to the nature of the request.

aguissas@gmail.com

SECTION 1. Summary for IMMA e-Atlas Pop-up Box

There has been a dramatic decline in dugongs in the Western Indian Ocean since the 1960s. Ten and 6 dugongs were counted off Kenya in the mid 1990s (Cockcroft, 1995; Komora, 1996; Wamukoya *et al.*, 1995; Marsh, *et al.*, 2002; Cockcroft *et al.*, 1994). Similar declines were noted for Tanzania, the Mascarene Islands (Cockcroft & Young, 1998; Muir *et al.*, 2003;) and Mozambique (Cockcroft & Young 1998). Based on boat, aerial and questionnaire surveys conducted from 1991/97 Cockcroft *et al.*, (1994) suggested that the Bazaruto Archipelago supported the last viable WIO population. Comprehensive aerial surveys of the Archipelago in 2007/2008 (Findlay *et al.*, 2011) estimated a population of between 250 and 350 individuals. Recent aerial, acoustic and questionnaire surveys off East African 'hot spots' suggest that dugongs are all but extirpated from the East African region, other than in the Bazaruto Archipelago (Cockcroft *et al.*, 2018).

SECTION 2. Information for IMMA Summary Box

Common Name	Scientific Name	IMMA Selection Criteria Met (x)							
		A	Bi	Bii	Ci	Cii	Ciii	Di	Dii*
Dugong	<i>Dugong dugon</i>	x	x						

IMMA Future Directions

- IMMAs give international scientific recognition to contribute to local or national protection efforts
- IMMAs with baseline studies can then be used to monitor against threats to cetaceans, ship strike, noise, climate change
- IMMAs will play a role in the United Nations BBNJ process helping to close data gaps in the high seas (e.g., using satellite images to detect whales, e-DNA, acoustics plus modelling, etc.)
- Northern hemisphere IMMA Workshops under discussion for 2022-2023; other regions to follow
- Monitoring and review of IMMAs and AoI needed regularly and in regions at least every 10 years.
- Selling and implementing the IMMA tool and integrating with other conservation tools.
